

AMERICAN ASSOCIATION OF SUICIDOLOGY

Elderly¹ Suicide Fact Sheet

- The elderly made up 12.5% of the population; they accounted for almost 15.7% of all suicides.
- The rate of suicide for the elderly for 2007 was 14.3 per 100,000.
- There was one elderly suicide every 97 minutes. There were about 14.9 elderly suicides each day, resulting in 5,421 suicides in among those 65 and older.
- Elderly white men were at the highest risk with a rate of approximately 31.1 suicides per 100,000 each year.
- White men over the age of 85, who are labeled “old-old”, were at the greatest risk of all age-gender-race groups. In 2007, the suicide rate for these men was 45.42 per 100,000. That was 2.5 times the current rate for men of all ages (18.3 per 100,000).
- 84.4% of elderly suicides were male; the rate of male suicides in late life was 7.3 times greater than for female suicides.

Suicide Rates for Ages 65 to 85+

¹ “Elderly” refers to persons over the age of 65. Information presented refers to the latest national data (2007).

- The suicide rate for the elderly reached a peak in 1987 at 21.8 per 100,000 people. Since 1987, the rate of elderly suicides has declined 28% (down to 14.3 in 2007). This is the largest decline in suicide rates among the elderly since the 1930's.
- The rate of suicide for women typically declines after age 60 (after peaking in middle adulthood, ages 45-49).
- Although older adults attempt suicide less often than those in other age groups, they have a higher completion rate. For all ages combined, there is an estimated 1 suicide for every 25 attempted suicides. Among the young (15-24 years) there is an estimated 1 suicide for every 100-200 attempts. Over the age of 65, there is one estimated suicide for every 4 attempted suicides.
- Firearms were the most common means (71.9%) used for completing suicide among the elderly. Men use firearms far more often than women.
- Alcohol or substance abuse plays a diminishing role in later life suicides compared to younger suicides.
- One of the leading causes of suicide among the elderly is depression, often undiagnosed and/or untreated.
- The act of completing suicide is rarely preceded by only one cause or one reason. In the elderly, common risk factors include:
 - The recent death of a loved one;
 - Physical illness, uncontrollable pain or the fear of a prolonged illness;
 - Perceived poor health;
 - Social isolation and loneliness;
 - Major changes in social roles (e.g. retirement).
